Hillpointe AP Automation Screen: One Page Summary

Jamie Collier | October 2026 | Workflow, evidence and logs are in the same package

My approach

AI reads, code decides, people approve. I used Claude to study the policy, build the workflow, write the tests and draft the documents. When the workflow runs, it reads each PDF into structured data, checks that the numbers tie, then applies the AP Coding Rules in plain code. Anything it cannot settle goes to a person with a reason, a route and a confidence level. It never guesses a vendor, a PO or a bank detail. A held document is never entered, not even in part.

What it produced

Run	Docs	Entered	Held	Duplicate	Import rows
Batch 01	15	7 (6 Intacct, 1 Entrata)	6	2	11
Batch 01 rerun	15	0 (7 skipped as already entered)	6	2	0
Batch 02	5	2	0	3	2
Batch 02 rerun	5	0 (2 skipped as already entered)	0	3	0

Across all four runs, every bill appears in exactly one import file, once. Six documents worth $203,140.87 were held: a PO overbill, an unexecuted change order, missing lien waivers, an expired insurance certificate, a new vendor, and a bank change request on an invoice from a known vendor with a different address and phone. The revised Harbor Point invoice was entered once, and its held original was closed out.

Checks that keep it accurate

- **Read, then verify.** Arithmetic on every document before any decision. A document that does not tie goes to a person.
- **Rules in one place.** Every threshold, route and keyword list lives in one config file. Each decision has a pass or fail trail you can print.
- **Tested.** 33 automated tests: a hand built answer key for all 20 documents, plus 17 edge cases I invented (PO tolerance boundary, inactive vendor name, wrong lien waiver amount, CFO threshold).
- **Pre-flight.** The Intacct file is checked the way Intacct would check it. A formula tab proves each bill equals the amount owed.
- **Duplicates.** Key is vendor plus cleaned invoice number, checked against ERP history and a plain CSV register of earlier runs.

What still needs a person

- **Holds:** Project Manager for the Pinecrest PO change order, Summit change order and the Harbor Point PO match. Compliance for lien waivers and the Tri County insurance. Vendor Master for Brightline. Treasury calls the number on file for Sterling Grounds and Pest before any payment changes.
- **Approvals:** Every entered bill still needs its listed approvers. Gulfline needs the VP Construction because gross work is over $100,000.
- **Judgment:** The sample lien waivers have blank signature lines, so someone must confirm the signed originals. My assumptions are listed in the README.

Time, rough estimate

By hand I would expect 10 to 15 minutes per document (read it, find the PO, search history, code it, key it), so about 3 hours for Batch 01 and about 1 hour for Batch 02. The workflow runs all four runs in about 6 seconds. A person then spends about 30 minutes reviewing the exception log and approvers. These are my estimates, not measured times.

What I would build next

1. Watch the AP inbox and run on a schedule.
2. Send each hold to its owner automatically, with a Treasury ticket for every bank change request.
3. Upload approved bills through the Intacct and Entrata APIs, with a person clicking approve.
4. Add OCR for scanned invoices and an accuracy report for the AI extraction step, using the live Claude path that I wrote but have not yet run against the API.
5. Track exception aging and which vendors cause the most holds.
